Examples and additional details are available in recommended textbook:

Microsoft Excel: Data Analysis and Business Modeling, Wayne L. Winston

Microsoft Goal Seek

4.1 Goal Seek

The goal seek command searches for a solution by varying a parameter until a solution is found. Definitions:

Set cell: formula for the answer that you are seeking

To value: value that you want to achieve

By changing cell: the cell that changes until the Set cell matches the To value.

In the example adapted from your book, let's find the price that results in a breakeven point. In other words, we will vary demand until profit equals zero. Use the spreadsheet tab GoalSeek. The following commands run GoalSeek.

1. Click on the Data tab at the top of the spreadsheet.
2. Click on What-if Analysis, Goal Seek.
3. For Set Cell, enter the cell that is the outcome variable that you want to match. Since we are measuring profit as the outcome, enter \$B\$7.
4. For the To Value, enter zero, since we are trying to find the break-even point.
5. For the By Changing Cell, enter the cell which will change, in this case price B1.
6. Click OK to find the solution.

You should get the solution shown below.

| | A | B | C | D | E | F |
|---|---------------|--------------|---|---|---|---|
| 1 | price | \$ 6.38 | | | | |
| 2 | demand | 7,590 | | | | |
| 3 | unit cost | \$ 0.45 | | | | |
| 4 | fixed cost | \$ 45,000.00 | | | | |
| 5 | revenue | \$ 48,415.48 | | | | |
| 6 | variable cost | \$ 3,415.48 | | | | |
| 7 | profit | \$ 0.00 | | | | |
| 8 | | | | | | |
| 9 | | | | | | |

7. Now rerun GoalSeek with a starting price of 0.
8. Click on What-if Analysis, Goal Seek.
9. For Set Cell, enter the cell that is the outcome variable that you want to match. Since we are measuring profit as the outcome, enter \$B\$7.
10. For the To Value, enter zero, since we are trying to find the break-even point.
11. For the By Changing Cell, enter the cell which will change, in this case price B1.
12. Click OK to find the solution.
13. What's the difference? Why?

The screenshot shows an Excel spreadsheet titled "Session4 Excel 365 - Saved". The ribbon is set to "Home". The formula bar shows "price". The spreadsheet data is as follows:

| | A | B | C | D | E | F |
|---|---------------|--------------|---|---|---|---|
| 1 | price | \$ 1.29 | | | | |
| 2 | demand | 53,360 | | | | |
| 3 | unit cost | \$ 0.45 | | | | |
| 4 | fixed cost | \$ 45,000.00 | | | | |
| 5 | revenue | \$ 69,012.02 | | | | |
| 6 | variable cost | \$ 24,012.02 | | | | |
| 7 | profit | \$ (0.00) | | | | |
| 8 | | | | | | |
| 9 | | | | | | |

At the bottom, a "GoalSeekSolution2" window is visible, indicating the goal of setting cell B7 to 0 by changing cell B1.

14. The profit curve is non-linear with two break-even points

Microsoft Solver

4.2 Solver Add-in

The Solver option is available as an add-in to Excel. The steps to add it are:

1. In Excel, click on the File tab, then Options
2. Click on Add-Ins
3. Click Analysis Tool Pack Add-in, then Go
4. Check the box for Solver Add-in, then OK

Introduction to solver

Solver has the ability to search for an optimal solution subject to constraint. In contrast, goal seek would search for a solution that would match a specific value, such as demand-supply=0. Solver will find the maximum or minimum of a function, called the optimal feasible solution, if one exists. In some cases, particularly overly constrained problems, there will be no solution.

Simple Optimization

Recall the price-demand function from earlier.

| | A | B | C | D | E | F |
|---|---------------|---------------|---|---|---|---|
| 1 | price | \$ 4.00 | | | | |
| 2 | demand | 29,000 | | | | |
| 3 | unit cost | \$ 0.45 | | | | |
| 4 | fixed cost | \$ 45,000.00 | | | | |
| 5 | revenue | \$ 116,000.00 | | | | |
| 6 | variable cost | \$ 13,050.00 | | | | |
| 7 | profit | \$ 57,950.00 | | | | |
| 8 | | | | | | |
| 9 | | | | | | |

As price increases, demand decreases. Attempt to find the price that maximizes profit by changing the price.

Let's use Solver to quickly calculate the optimal price.

1. Click on the Data tab, then click on Solver.
2. The Objective is the cell that you want to maximize or minimize. We want to maximize profit, so enter B7 in the objective, and click on Max
3. Since we want to find the price that results in maximum profit, we will change price until we find a solution. In the box labelled "By Changing Variable Cells", enter B1, which is where price is stored.
4. Now click Solve.

Solver Parameters

Set Objective:

To: ☒ Max ☐ Min ☐ Value Of:

By Changing Variable Cells:

Subject to the Constraints:

☒ Make Unconstrained Variables Non-Negative

Select a Solving Method:

Solving Method
Select the GRG Nonlinear engine for Solver Problems that are smooth nonlinear. Select the LP Simplex engine for linear Solver Problems, and select the Evolutionary engine for Solver problems that are non-smooth.

Buttons: Add, Change, Delete, Reset All, Load/Save, Help, Solve, Close

You can keep the solver solutions or restore original values.

| | A | B | C | D | E | F |
|---|---------------|---------------|---|---|---|---|
| 1 | price | \$ 3.84 | | | | |
| 2 | demand | 30,475 | | | | |
| 3 | unit cost | \$ 0.45 | | | | |
| 4 | fixed cost | \$ 45,000.00 | | | | |
| 5 | revenue | \$ 116,905.49 | | | | |
| 6 | variable cost | \$ 13,713.75 | | | | |
| 7 | profit | \$ 58,191.74 | | | | |
| 8 | | | | | | |
| 9 | | | | | | |

ProfitOptimization

4.3 Useful Functions for Solver

One function that is helpful in setting up optimization problems is the SUMPRODUCT function. SUMPRODUCT first multiplies two columns or rows together (product), then adds the resulting values (sum). In the example below, labor used in cell D14=SUMPRODUCT(\$D\$2:\$I\$2,D4:I4), which will multiply the values in D2:I2 against the paired value in D4:I4, i.e., D2*D4, E2*E4, etc., then add together the results. How are profit in cell D12 and raw material used in D15 calculated? This concept will be used in each of the following chapters.

Use the ProdMix spreadsheet to see the example below.

| | A | B | C | D | E | F | G | H | I | J |
|----|---|-----------|-------------------|----------|----------|-----------|---------|---------|---------|---|
| 1 | | | | | | | | | | |
| 2 | | | Pounds made | 0 | 0 | 0 | 0 | 0 | 0 | |
| 3 | | Available | Product | 1 | 2 | 3 | 4 | 5 | 6 | |
| 4 | | 4500 | Labor | 6 | 5 | 4 | 3 | 2.5 | 1.5 | |
| 5 | | 1600 | Raw Material | 3.2 | 2.6 | 1.5 | 0.8 | 0.7 | 0.3 | |
| 6 | | | Unit price | \$ 12.50 | \$ 11.00 | \$ 9.00 | \$ 7.00 | \$ 6.00 | \$ 3.00 | |
| 7 | | | Variable cost | \$ 6.50 | \$ 5.70 | \$ 3.60 | \$ 2.80 | \$ 2.20 | \$ 1.20 | |
| 8 | | | Demand | 960 | 928 | 1041 | 977 | 1084 | 1055 | |
| 9 | | | Unit profit cont. | \$ 6.00 | \$ 5.30 | \$ 5.40 | \$ 4.20 | \$ 3.80 | \$ 1.80 | |
| 10 | | | | | | | | | | |
| 11 | | | | | | | | | | |
| 12 | | | Profit | \$ - | | | | | | |
| 13 | | | | | | Available | | | | |
| 14 | | | Labor Used | 0 <= | | 4500 | | | | |
| 15 | | | Raw Material Used | 0 <= | | 1600 | | | | |
| 16 | | | | | | | | | | |

4.4 Optimal product mix

For this problem, use the ProdMix spreadsheet.

In the optimal product mix problem, we are trying to produce six different products, where the labor and raw materials are constrained. The goal is to find the production volumes for each product that maximizes profitability.

| | A | B | C | D | E | F | G | H | I | J |
|----|---|-----------|-------------------|----------|----------|-----------|---------|---------|---------|---|
| 1 | | | | | | | | | | |
| 2 | | | Pounds made | 0 | 0 | 0 | 0 | 0 | 0 | |
| 3 | | Available | Product | 1 | 2 | 3 | 4 | 5 | 6 | |
| 4 | | 4500 | Labor | 6 | 5 | 4 | 3 | 2.5 | 1.5 | |
| 5 | | 1600 | Raw Material | 3.2 | 2.6 | 1.5 | 0.8 | 0.7 | 0.3 | |
| 6 | | | Unit price | \$ 12.50 | \$ 11.00 | \$ 9.00 | \$ 7.00 | \$ 6.00 | \$ 3.00 | |
| 7 | | | Variable cost | \$ 6.50 | \$ 5.70 | \$ 3.60 | \$ 2.80 | \$ 2.20 | \$ 1.20 | |
| 8 | | | Demand | 960 | 928 | 1041 | 977 | 1084 | 1055 | |
| 9 | | | Unit profit cont. | \$ 6.00 | \$ 5.30 | \$ 5.40 | \$ 4.20 | \$ 3.80 | \$ 1.80 | |
| 10 | | | | | | | | | | |
| 11 | | | | | | | | | | |
| 12 | | | Profit | \$ - | | | | | | |
| 13 | | | | | | Available | | | | |
| 14 | | | Labor Used | 0 <= | | 4500 | | | | |
| 15 | | | Raw Material Used | 0 <= | | 1600 | | | | |

The product numbers are listed in row 3, with the labor hours and raw material required to produce one pound of that product in rows 4 and 5. The maximum demand is in row 8. The maximum labor and raw materials available are also identified. Demand, labor and raw materials are constraints.

To use solver, follow these steps:

1. Click on the Data tab
2. In the Analysis group, click Solver.
3. Set Objective to the cell that you want to maximize or minimize. In this case, set it to profit (\$D\$12)
4. Since we want to maximize profit, make sure the Max button is checked.
5. By Changing Cell refers to what you want to vary. In this case, we want to vary product quantities to find the optimal production quantities. Click in the box and set this to D2:I2. The screen should look like the picture below.

Solver Parameters

Set Objective:

To: ☒ Max ☐ Min ☐ Value Of:

By Changing Variable Cells:

Subject to the Constraints:

☒ Make Unconstrained Variables Non-Negative

Select a Solving Method: Options

Solving Method

Select the GRG Nonlinear engine for Solver Problems that are smooth nonlinear. Select the LP Simplex engine for linear Solver Problems, and select the Evolutionary engine for Solver problems that are non-smooth.

Buttons: Add, Change, Delete, Reset All, Load/Save, Options, Help, Solve, Close

6. Next, add the constraints. First, click the Add button.
7. We want to impose a labor and resource constraint. We can do both simultaneously by entering D14:D15 and F14:F15 as below. Set the constraint direction to <=.
8. Click Add to add another constraint.

Add Constraint

Cell Reference: Constraint:

Buttons: OK, Add, Cancel

9. We also want to make sure that we don't produce more than is demanded. After clicking add in the earlier step, Add Constraint let's you add more constraints. In this case, production (row 2) should not exceed demand (row 8). Set this demand constraint by entering D2:I2 and D8:I8. Set the constraint direction to <=.

Add Constraint

Cell Reference: Constraint:

Buttons: OK, Add, Cancel

10. Since this is the last constraint, click OK. You should be returned to the following screen.

The Solver Parameters dialog box is shown with the following settings:

- Set Objective:** \$D\$12
- To:** ☒ Max, ☐ Min, ☐ Value Of: 0
- By Changing Variable Cells:** \$D\$2:\$I\$2
- Subject to the Constraints:**
 - \$D\$14:\$D\$15 <= \$F\$14:\$F\$15
 - \$D\$2:\$I\$2 <= \$D\$8:\$I\$8
- ☒ Make Unconstrained Variables Non-Negative
- Select a Solving Method:** GRG Nonlinear
- Solving Method:** Select the GRG Nonlinear engine for Solver Problems that are smooth nonlinear. Select the LP Simplex engine for linear Solver Problems, and select the Evolutionary engine for Solver problems that are non-smooth.

Buttons at the bottom: Help, Solve (highlighted), Close.

11. Finally, click on Solve. Select Keep Solver Solution if you want to save your answer. You can select three reports (Answer, Sensitivity, Limits) by clicking on them.

The Solver Results dialog box is shown with the following settings:

- Solver found a solution. All Constraints and optimality conditions are satisfied.**
- Keep Solver Solution** (selected), ☐ Restore Original Values
- ☐ Return to Solver Parameters Dialog, ☐ Outline Reports
- Reports:** Answer, Sensitivity, Limits

Buttons at the bottom: OK (highlighted), Cancel, Save Scenario...

Solver found a solution. All Constraints and optimality conditions are satisfied.

When the GRG engine is used, Solver has found at least a local optimal solution. When Simplex LP is used, this means Solver has found a global optimal solution.

12. When you have made your selections, click OK. You should see the solution shown below. If you clicked on the additional reports, they will be listed as separate tabs.

The screenshot shows the Microsoft Excel interface with the 'Data' tab selected. The worksheet contains a table with the following data:

| | A | B | C | D | E | F | G | H | I |
|----|---|---|-------------------|------------|----------|-----------|----------|---------|---------|
| 1 | | | | | | | | | |
| 2 | | | Pounds made | 0 | 0 | 0 | 596.6667 | 1084 | 0 |
| 3 | | | Available Product | 1 | 2 | 3 | 4 | 5 | 6 |
| 4 | | | 4500 Labor | 6 | 5 | 4 | 3 | 2.5 | 1.5 |
| 5 | | | 1600 Raw Material | 3.2 | 2.6 | 1.5 | 0.8 | 0.7 | 0.3 |
| 6 | | | Unit price | \$ 12.50 | \$ 11.00 | \$ 9.00 | \$ 7.00 | \$ 6.00 | \$ 3.00 |
| 7 | | | Variable cost | \$ 6.50 | \$ 5.70 | \$ 3.60 | \$ 2.80 | \$ 2.20 | \$ 1.20 |
| 8 | | | Demand | 960 | 928 | 1041 | 977 | 1084 | 1055 |
| 9 | | | Unit profit cont. | \$ 6.00 | \$ 5.30 | \$ 5.40 | \$ 4.20 | \$ 3.80 | \$ 1.80 |
| 10 | | | | | | | | | |
| 11 | | | | | | | | | |
| 12 | | | Profit | \$6,625.20 | | | | | |
| 13 | | | | | | Available | | | |
| 14 | | | Labor Used | 4500 | <= | 4500 | | | |
| 15 | | | Raw Material Used | 1236.1333 | <= | 1600 | | | |

The Excel interface also shows the 'Data' ribbon with various tools like 'Get Data', 'Refresh All', 'Data Types', 'Sort & Filter', 'Data Tools', 'Forecast', 'Outline', and 'Data Analysis Solver'. The status bar at the bottom indicates 'Ready' and '100%' zoom.

4.5 Schedule workforce

In this example, we are trying to staff a bank with a minimum number of employees by day. The employees can work five consecutive days, starting on any one day. How many employees are needed to work in each shift? Use the Bank Staffing spreadsheet.

| | A | B | C | D | E | F | G | H | I | J |
|----|----------|----------------|---|---------|-----------|----------|--------|----------|--------|---|
| 1 | | | | | | | | | | |
| 2 | Total | | There are multiple solutions all of which use 20 workers. | | | | | | | |
| 3 | 0 | | Working? | | | | | | | |
| 4 | Number | Day worker | | | | | | | | |
| | starting | starts | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday | Sunday | |
| 5 | 0 | Monday | 1 | 1 | 1 | 1 | 1 | 0 | 0 | |
| 6 | 0 | Tuesday | 0 | 1 | 1 | 1 | 1 | 1 | 0 | |
| 7 | 0 | Wednesday | 0 | 0 | 1 | 1 | 1 | 1 | 1 | |
| 8 | 0 | Thursday | 1 | 0 | 0 | 1 | 1 | 1 | 1 | |
| 9 | 0 | Friday | 1 | 1 | 0 | 0 | 1 | 1 | 1 | |
| 10 | 0 | Saturday | 1 | 1 | 1 | 0 | 0 | 1 | 1 | |
| 11 | 0 | Sunday | 1 | 1 | 1 | 1 | 0 | 0 | 1 | |
| 12 | | Number working | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |
| 13 | | | >= | >= | >= | >= | >= | >= | >= | |
| 14 | | Number needed | 17 | 13 | 15 | 17 | 9 | 9 | 12 | |
| 15 | | | | | | | | | | |

Cells A5:A11 have an initial assignment of people to shifts. Cell A5=1 means that one person will start working on a Monday. The cells C5:I5 show the days worked for a “Monday” shift. To calculate how many people are working each day, the Number working is the sumproduct. Management has determined the minimum number of employees that are required per day, listed as number needed. Now, let’s find a solution. The steps are:

1. Objective: minimize the number of employees
2. Changing cells: number of employees who start work for each shift
3. Constraints: number of employees working must be greater than or equal to the number of employees required.
4. Also, set a constraint that you should have whole people, i.e., people are integer.

Solver Parameters

Set Objective:

BankStaffingSolution TransDist Tr: ...

Ready 100%

4.6 Transportation and distribution

The transportation and distribution problem describes an opportunity to minimize transportation costs. There are three distribution centers with inventory to be shipped to four destinations. The goal is to minimize transportation costs but satisfy all demand for the products at all locations. Use the TransDist spreadsheet. The initial spreadsheet looks like the picture below:

| | A | B | C | D | E | F | G | H | I | J |
|----|---------------|---------|---------|---------|---------|----------|---|----------|---|---|
| 1 | DEMAND | 9000 | 6000 | 6000 | 13000 | | | | | |
| 2 | | EAST | MIDWEST | SOUTH | WEST | CAPACITY | | | | |
| 3 | LA | \$ 5.00 | \$ 3.50 | \$ 4.20 | \$ 2.20 | 10000 | | | | |
| 4 | ATLANTA | \$ 3.20 | \$ 2.60 | \$ 1.80 | \$ 4.80 | 12000 | | | | |
| 5 | NEW YORK CITY | \$ 2.50 | \$ 3.10 | \$ 3.30 | \$ 5.40 | 14000 | | | | |
| 6 | | | | | | | | | | |
| 7 | SHIPMENTS | | | | | | | | | |
| 8 | | EAST | MIDWEST | SOUTH | WEST | Sent | | Capacity | | |
| 9 | LA | 0 | 0 | 0 | 0 | 0 <= | | 10000 | | |
| 10 | ATLANTA | 0 | 0 | 0 | 0 | 0 <= | | 12000 | | |
| 11 | NEW YORK CITY | 0 | 0 | 0 | 0 | 0 <= | | 14000 | | |
| 12 | Received | 0 | 0 | 0 | 0 | | | | | |
| 13 | | >= | >= | >= | >= | | | | | |
| 14 | Demand | 9000 | 6000 | 6000 | 13000 | | | | | |
| 15 | | | | | | | | | | |
| 16 | Total Cost | | | | | | | | | |

The steps to minimize cost are:

1. Set the Objective to the total cost B16. See the formula in the cell. Why does this work?
2. Set the changing cells (B9:E11) to amount in inventory at each city which is shipped to each region (destination).
3. Set the constraints to reflect the capacity of the distribution center (Sent <= Capacity)
4. Set the constraints to reflect that you must satisfy demand for each region (Received >= Demand)

TransDistSolution CapitalBudgeting

Ready

4.7 Capital budgeting

Using NPV (net present value) and IRR (internal rate of return), we are able to compare projects. Solver can be used for Capital Budgeting to select the optimal projects from a budgeting perspective.

In this case, we will use a trick called binary changing cells. A binary changing cell has a value of one or zero, reflecting that a project is selected or not. We will use a constraint of “bin” to designate a binary changing cell.

The screenshot shows an Excel spreadsheet titled 'CapitalBudgeting' with the following data:

| Do it? | NPV | Cost Year 1 | Cost Year 2 | Cost Year 3 | Labor Year 1 | Labor Year 2 | Labor Year 3 |
|--------|-----|-------------|-------------|-------------|--------------|--------------|--------------|
| 0 | 928 | 398 | 180 | 368 | 111 | 108 | 123 |
| 0 | 908 | 151 | 269 | 248 | 139 | 86 | 83 |
| 0 | 801 | 129 | 189 | 308 | 56 | 61 | 23 |
| 0 | 543 | 275 | 218 | 220 | 54 | 70 | 59 |
| 0 | 944 | 291 | 252 | 228 | 123 | 141 | 70 |
| 0 | 848 | 80 | 283 | 285 | 119 | 84 | 37 |
| 0 | 545 | 203 | 220 | 77 | 54 | 44 | 42 |

In the spreadsheet above, there are 20 projects, each with an NPV, yearly cost and yearly labor requirement. However, there also is a limit to available funds and personnel, listed in the Available row. Your objective is to select the projects within the funding and personnel constraints which maximize total NPV.

The following steps maximize NPV:

1. Set target cell to Total NPV value.
2. Set changing cells to the range of A6:A25 zeroes and ones.
3. Set constraints to reflect that funds and employees (E2:J2) used cannot exceed what is available (E4:J4).
4. Now click Solve to see the result.

CapitalBudgetingSolution WarehouseLocation1

- How would you handle other constraints, such as, if you select project 4, then project 3 must also be selected?
- If you only have four project managers, how would you limit the selection to four projects?

4.8 Warehouse Location – One Warehouse

You can use solver to find the optimal location for a warehouse, which minimizes the shipping distances for all shipments. We will try to find the optimal location for one warehouse to minimize shipment miles across the country, then expand to two warehouses.

1. For the first example in locating one warehouse, use the WarehouseLocation1 spreadsheet.

The screenshot shows an Excel spreadsheet with the following data:

| | A | B | C | D | E | F |
|----|----------------|------|-------|-----------|-------------|--------------|
| 1 | Lat | Long | | | | |
| 2 | Warehouse 1 | 0 | 0 | | | |
| 3 | | | | | | |
| 4 | City | Lat | Long | Shipments | Distance | Shipped*Dist |
| 5 | New York | 40.7 | 73.9 | 15 | 5821.285915 | 87319.28872 |
| 6 | Boston | 42.3 | 71 | 8 | 5702.54423 | 45620.35384 |
| 7 | Philadelphia | 40 | 75.1 | 10 | 5871.089133 | 58710.89133 |
| 8 | Charlotte | 35.2 | 80.8 | 6 | 6081.27655 | 36487.6593 |
| 9 | Atlanta | 33.8 | 84.4 | 11 | 6273.234716 | 69005.58187 |
| 10 | New Orleans | 30 | 89.9 | 8 | 6539.369206 | 52314.95365 |

| 15 | Detroit | 42.4 | 83.1 | 11 | 6437.137918 | 70808.51709 |
| 16 | Cleveland | 41.5 | 81.7 | 8 | 6322.877789 | 50583.02232 |
| 17 | Indy | 39.8 | 86.1 | 7 | 6544.91461 | 45814.40227 |
| 18 | Denver | 39.8 | 104.9 | 8 | 7741.557082 | 61932.45665 |
| 19 | Minneapolis | 45 | 93.3 | 9 | 7147.377581 | 64326.39823 |
| 20 | Phoenix | 33.5 | 112.1 | 11 | 8072.899743 | 88801.89717 |
| 21 | Salt Lake City | 40.8 | 111.9 | 10 | 8218.317118 | 82183.17118 |
| 22 | LA | 34.1 | 118.4 | 18 | 8501.676456 | 153030.1762 |
| 23 | SF | 37.8 | 122.6 | 12 | 8852.353111 | 106228.2373 |
| 24 | SD | 32.8 | 117.1 | 10 | 8390.879468 | 83908.79468 |
| 25 | Seattle | 41.6 | 122.4 | 13 | 8920.05356 | 115960.6963 |

2. Each city is identified with latitude and longitude, the number of shipments going to that city, calculated distance from the city to the warehouse, and shipping miles (Shipped*Dist) for each city
3. The goal is to minimize the Total Distance by finding the best location for warehouse 1.

4. To calculate the distance from each city to the warehouse, we will use the Pythagorean theorem:

$$C^2 = A^2 + B^2$$

5. Or, taking the square root of both sides:

$$C = \text{SQRT}(A^2 + B^2)$$

6. For example, to calculate the distance from Dallas to Columbus:

7. We can approximate the distance A:

$$A = \text{latitude of Columbus} - \text{latitude of Dallas}$$

8. We can approximate the distance B:

$$B = \text{longitude of Columbus} - \text{longitude of Dallas}$$

9. Then the distance C is:

$$C = \text{SQRT}((\text{lat}(\text{Columbus}) - \text{lat}(\text{Dallas}))^2 + (\text{long}(\text{Columbus}) - \text{long}(\text{Dallas}))^2)$$

10. One degree of latitude or longitude is approximately 69 miles, so the distance in miles is:

$$\text{Distance} = 69 * \text{SQRT}((\text{lat}(\text{Columbus}) - \text{lat}(\text{Dallas}))^2 + (\text{long}(\text{Columbus}) - \text{long}(\text{Dallas}))^2)$$

11. In column E, we calculate the distance from the warehouse to each city.
12. In column F, calculate the number of shipments * distance, so we have total miles driven.
13. In F27, create total distance for all cities

| | A | B | C | D | E | F |
|----|----------------|------|-------|-----------|-------------|--------------|
| | | Lat | Long | | | |
| 1 | | | | | | |
| 2 | Warehouse 1 | 0 | 0 | | | |
| 3 | | | | | | |
| 4 | City | Lat | Long | Shipments | Distance | Shipped*Dist |

4.9 Solving Non-linear Problems in Solver

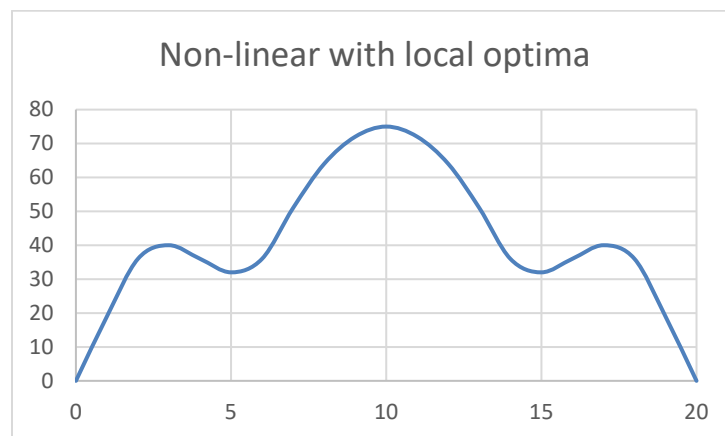

The simplest Objective curves will be linear. The Simplex method is sufficient when the function is linear.

Non-linear equations require a non-linear solution. GRG Nonlinear can solve this.

Non-linear with local optima require multiple starting points. GRG Nonlinear with multi-start works here.

Equations with point having no slope or discontinuous functions must use evolutionary.

Summary of technique selection

The following table summarizes which techniques can solve each type of problem.

| Problem | Solution Technique | | | |
|-------------------------------|--------------------|----------------|---------------------------------|--------------|
| | Simplex | GRG Non-linear | GRG Non-linear with multi-start | Evolutionary |
| Linear | Yes | Yes | Yes | Yes |
| Nonlinear, one optimum | No | Yes | Yes | Yes |
| Nonlinear, multiple optima | No | No | Yes | Yes |
| Curve has point with no slope | No | No | No | Yes |
| Speed | Fastest | Fast | Slow | Slowest |

| 26 | | | | | | | | |
| 27 | | | | | | | Total | 1595733.10 |
| 28 | | | | | | | Mean Dist | 7123.81 |

1. The latitude and longitude for our two warehouses are at the top of the screen.
2. The only additions that we have are two distance calculations (city to warehouse 1 and city to warehouse 2) and the minimum distance of the two. Our goal is to minimize total distance. In this case, we will assume that each city will receive shipments from the warehouse that is closest
3. To run solver, click on the Data tab, then Solver
4. The objective is to minimize total distance, so enter F27 in Set Objective
5. We want to change the warehouse location, so set By Change Variable Cells to B2:C3, the latitude and longitude for the warehouses
6. Select a solving method of GRG nonlinear.
7. Click Solve
8. Does the result make sense? The two warehouses are located in the same latitude and longitude.
9. Solver is stuck in a local solution

10. Now, let's use GRG Nonlinear with multiple start points
11. Click on solver
12. Next to GRG Nonlinear, click on Options
13. Click on the tab GRG Nonlinear
14. Check the box Use Multistart, then click OK
15. Note that it requires bounds on variables

16. Next add constraints that put bounds on the variables
17. In the Solver Parameters screen, under constraints, click Add
18. Add a constraint for B2:B3 ≥ 0
19. Add a constraint for B2:B3 ≤ 90
20. Add a constraint for C2:C3 ≥ 0
21. Add a constraint for C2:C3 ≤ 150
22. Click Solve
23. Use Google Maps to find the locations of the two warehouses

Solver Parameters

Set Objective:

To: ☐ Max ☒ Min ☐ Value Of:

By Changing Variable Cells:

Subject to the Constraints:

\$B\$2:\$B\$3 <= 90

\$B\$2:\$B\$3 >= 0

\$C\$2:\$C\$3 <= 150

\$C\$2:\$C\$3 >= 0

☒ Make Unconstrained Variables Non-Negative

Select a Solving Method:

Solving Method

Select the GRG Nonlinear engine for Solver Problems that are smooth nonlinear. Select the LP Simplex engine for linear Solver Problems, and select the Evolutionary engine for Solver problems that are non-smooth.

4.11 Evolutionary Solver

Run the same problem with Evolutionary

1. Set the objective to Total Distance (H27)
2. Set to Min so we minimize Total Distance
3. Set By Changing Variable Cells to B2:C3
4. Add a constraint for B2:B3 ≥ 0
5. Add a constraint for B2:B3 ≤ 90
6. Add a constraint for C2:C3 ≥ 0
7. Add a constraint for C2:C3 ≤ 150

8. Change Select a Solving Method to Evolutionary
9. Click on Options next to Evolutionary
10. Change Mutation Rate to 0.5
11. Check the box Require Bounds on Variables
12. Click OK

13. Solver will return the Evolutionary solution

The screenshot shows an Excel spreadsheet with the following data:

| | A | B | C | D | E | F | G | H | I |
|----|----------------|----------|----------|-----------|---------------|---------------|--------------|---------------|---|
